Estimation of Nitrate Load from Septic Systems to Surface Water Bodies Using ArcNLET: an ArcGIS-Based Nitrate Load Estimation Toolkit

Richard W. Hicks (FDEP) and Ming Ye (FSU)

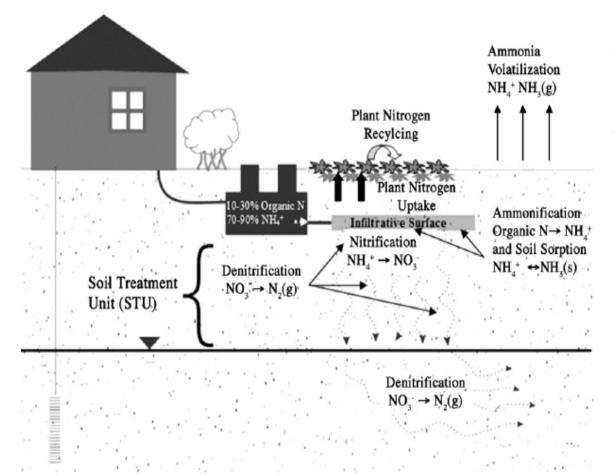

2011 Environmental Symposium Project WM956 Supported by FDEP

# Nitrate Fate and Transport in Groundwater

From Heatwole and McCray (2007)

Schematic of an Onsite Sewage Treatment and Disposal System (OSTDS) and Subsurface Nitrogen Transformation and Removal Processes

Approximately one-third of the population of Florida utilizes OWTS for wastewater treatment. (Ursin and Roeder, 2008, FDOH)

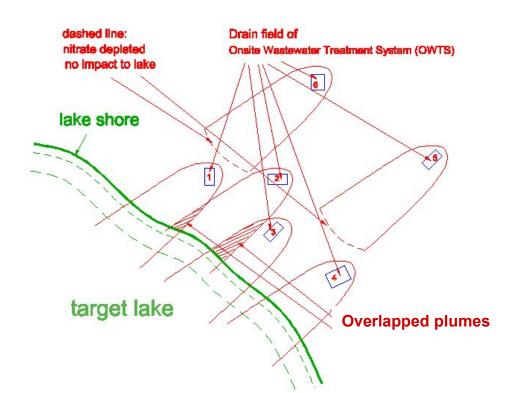

Ninety percent of the water used for drinking comes from the ground water. (FDEP, 2006)

From Heatwole and McCray (2007)

### Motivations

Traditional estimate of nitrate loading (e.g., in TMDL) may ignore

- Nitrate from normally working septic systems
- Denitrification process in groundwater occurring between drainfield and surface water body
- Effect of spatial locations of septic systems on nitrate load

### Motivations

#### Consequence

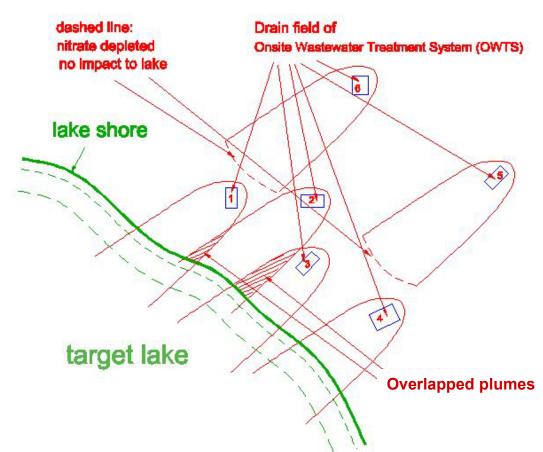

- Under-estimation of nitrate load by ignoring working septic systems
- Over-estimation of nitrate load by ignoring denitrification
- Sophisticated numerical models have been developed to study fate and transport of nitrate from septic system, but they may not be the most suitable tool for certain types of estimation (e.g., in TMDL) for the following reasons:
  - Burden for general users to set up model runs
  - Trained professional to operate the models and interpret modeling results
  - Large input and calibration data and long time of model execution and calibration

# **Project Goal**

- Goal: To develop a simplified model and software to support the TMDL and other environmental projects.
- It should be scientifically defensible under scrutiny.
- It should be user-friendly, easy to use, and GISbased to incorporate location information for both septic tank cluster and surface water receiving nitrate load.
- It should be available in public domain, to be used by all parties, including the challengers and for comparison reasons

# **Conceptual Model**

Consider key hydrogeologic processes involved in nitrate transport: • Groundwater flow

- Groundwater flow model to estimate
  - flow path
  - flow velocity
  - travel time
- Nitrate transport model
  - to consider
  - Advection
  - Dispersion
  - Denitrification
- Load estimation model to estimate nitrate load

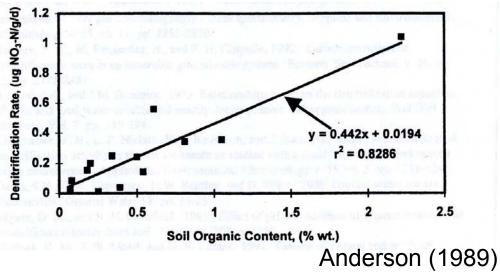

#### Denitrification

Denitrification refers to the biological reduction of nitrate to nitrogen gas.

 $NO_3^- + Organic carbon \rightarrow NO_2^- + Organic carbon \rightarrow N_2 + CO_2 + H_2O$  $NO_3^- \rightarrow NO_2^- \rightarrow NO \rightarrow N_2O \rightarrow N_2$ 

Denitrification ... has been identified as basic factor contributing to the generally low levels of nitrate found in the groundwater of the southeastern United States (Fedkiw, 1991).

A fairly broad range of heterotrophic anaerobic bacteria are involved in the process, requiring an organic carbon source for energy as follows

# **Estimation of Nitrate Load**

- M<sub>out</sub> (M/T): nitrate load to rivers
- M<sub>in</sub> (M/T): nitrate from septic tanks to surficial aquifer
- M<sub>dn</sub> (M/T): nitrate loss due to denitrification

$$M_{dn} = R_{dn}V_g$$
  
 $R_{dn} (M/T/L^3)$ : denitrification rate  
 $V_g (L^3)$ : volume of groundwater solution, estimated  
from groundwater flow and reactive transport  
modeling

# Example of simulated nitrate plumes

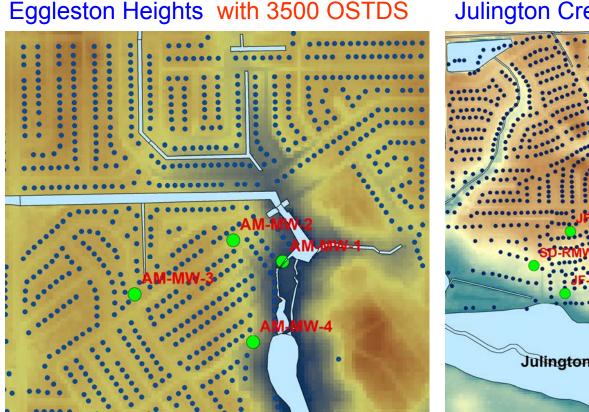

# ArcNLET

The software is developed as an extension of ArcGIS 9.3 and ArcGIS 10

Free download at http://people.sc.fsu.edu/~mye/ArcNLET/

# Filed Application at Eggleston Heights and Julington Creek Neighborhoods, Jacksonville, FL

Julington Creek with 1978 OSTDS

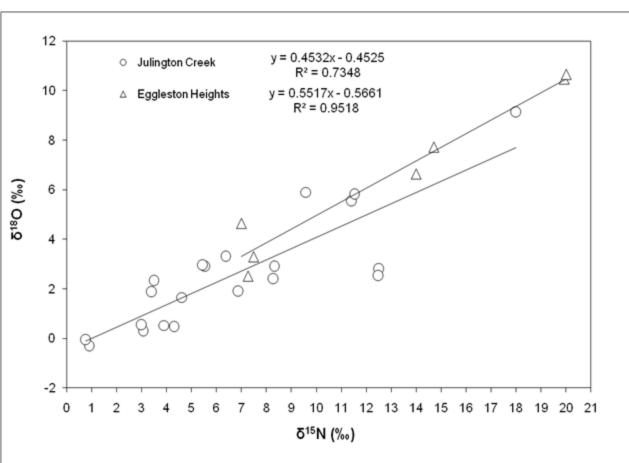

Reasons of selecting the two sites:

- Nitrate due to septic systems is believed to be one of the reasons of nutrient enrichment in surface water bodies (Leggette et al., 2004)
- Relatively large amount of observations of hydraulic head and nitrate concentrations are available.

#### Isotope Signature of Denitrification

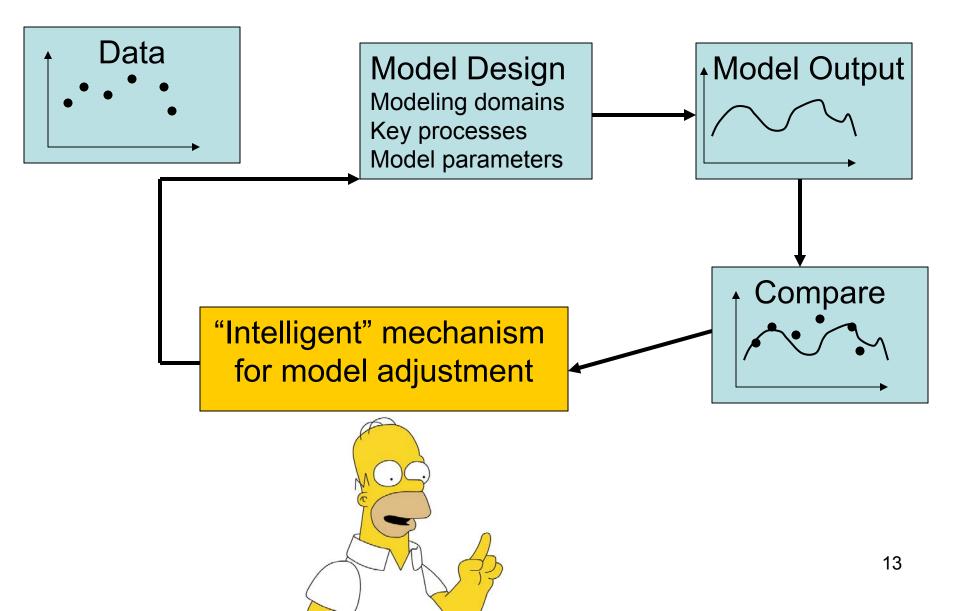

Indication of denitrification occurrence (Chen and Mcquarrie, 2005):

- Linear relationship
- Slope close to 0.51

 $\delta^{18}$ O vs.  $\delta^{15}$ N at Julington Creek and Eggleston Heights (Sep & Oct, 2010).

#### Model Calibration: Trial and Error

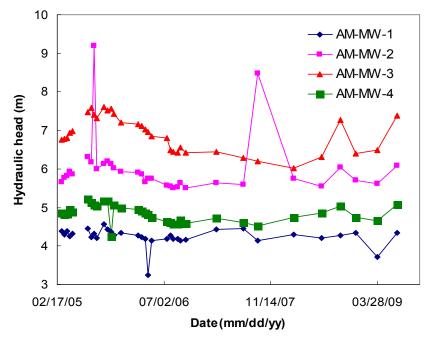

### **Global Sensitivity Analysis**

Х

Two parameters most critical to simulated nitrate concentration at selected locations of the plume

#### Observations of Hydraulic Head and Nitrate Concentration

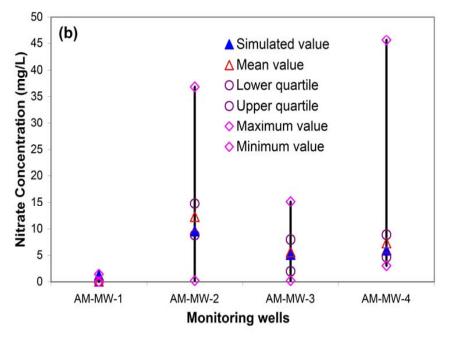

- The observed concentrations have large fluctuation due to complicated nitrogen transport and transformation mechanisms.
- No trend is observed.
- The mean value and ranges between upper and lower quartile are used as the calibration targets.

- The observed water tables are relatively stable.
- It is reasonable to assume steadystate flow.
- The mean values are used as calibration targets.

#### Calibration Results of Nitrate Concentration

#### **Eggleston Heights**

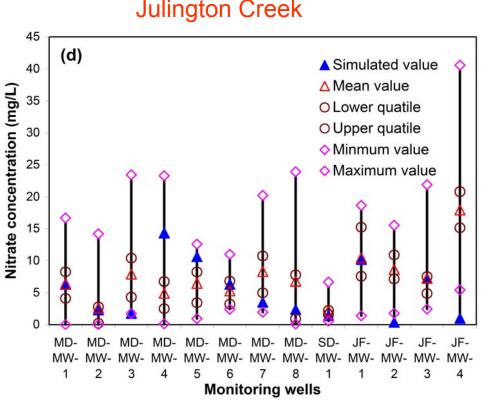

The simulated nitrate concentrations are

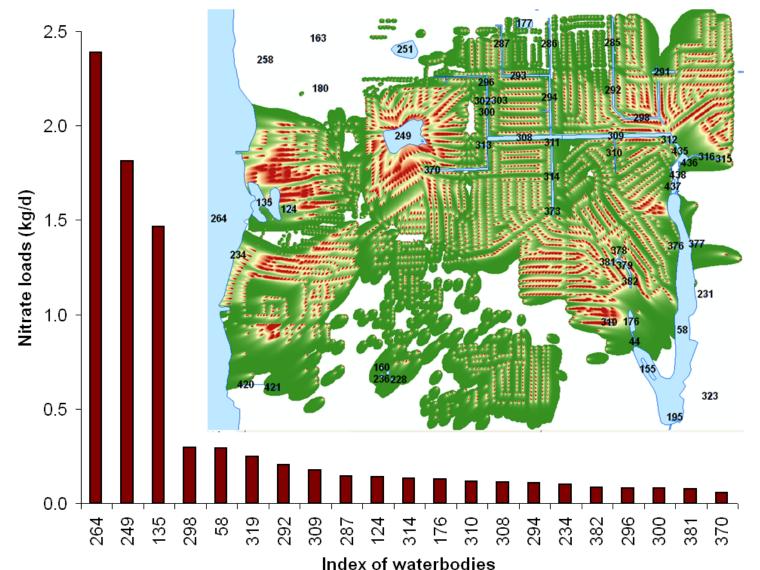

- Close to the mean observations at seven out of 13 wells, and
- Fall within the minimum and maximum ranges of the observed concentrations at 11 out of 13 wells.

The simulated nitrate concentrations are

- Close to the mean observations, and
- Fall within the inter-quartile of the observed concentrations.

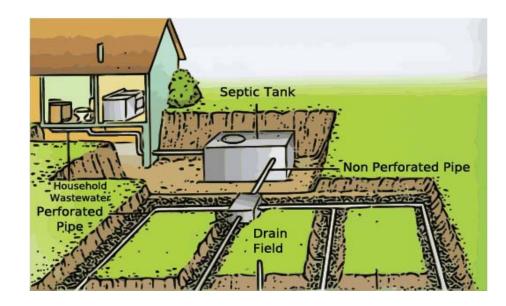

#### Nitrate Loads Estimation for Eggleston Heights Neighborhood

### Conclusions

- ArcNLET, the ArcGIS-based software has been developed for simulation of nitrate transport and estimation of nitrate load from septic systems to surface water bodies.
- The software is user friendly and easy to operate.
- After being calibrated, ArcNLET can yield acceptable simulations of field observations and reasonable load estimates.
- The software is based on a simplified conceptual model of nitrate transport, and should be used as a screening tool for load estimation.
- It is free for download at http://people.sc.fsu.edu/~mye/ArcNLET/.
- A software training workshop was given in July to 15 people, and another one is scheduled in fall. Email <u>mye@fsu.edu</u> if interested.

#### Questions?

#### Modeling Procedure: **Data Preparation**

- $N_t = N_0 R_{dn}V_{aq}$
- Input the topographic map of the selected site.
- Input the map of septic tank locations. The location can be obtained from the county property appraiser's office. If the actual location of the septic tank on each property lot is unknown, the center of the property polygon will be used as the septic system location.
- Delineate boundary line of target surface water body (e.g., a lake and/or a stream) based on the topographic map. The boundary line can be of any shape.
- Delineate parameter zones of hydraulic conductivity, percent of soil organic carbon, porosity, and dispersion coefficients to incorporate heterogeneity of the aquifer. These hydraulic properties can be obtained from literature and/or field/laboratory experiments. 20

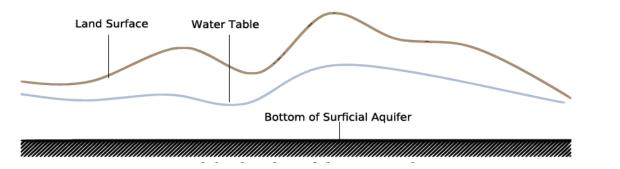

# Modeling Procedure: Estimation

- Determine hydraulic gradient along the flowpath from each septic system to the boundary line.
- For each septic system, calculate the travel time for each segment based on the Darcy's law. The travel time varies for each segment of each septic system.
- For each septic system, calculate aquifer volume within which denitrification would occur using the analytical solution of Domenico and Robbins (1985).
- Calculate N loss for each septic tank.
- Calculate nitrate load to the target surface water for each septic tank.
- Sum the load for all the septic tank.

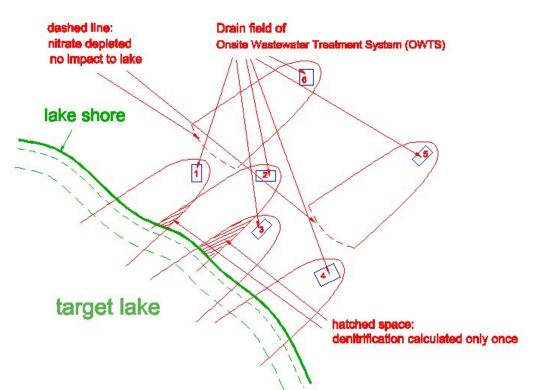

# **Groundwater Flow Modeling**

#### **Assumptions** and **Approximations**:

- Steady-state flow
- Ignore mounding on top of water table
- Use Dupuit assumption to simulate 2-D groundwater flow
- Treat water table as subdued replica of the topography
- Process topographic data and approximate hydraulic gradient using the topographic gradient

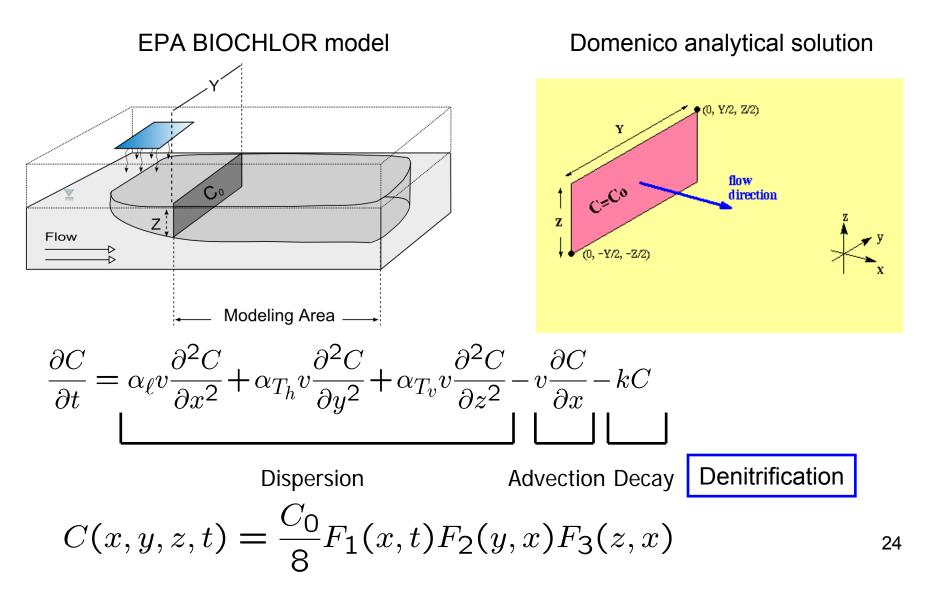

# Outputs of Groundwater Flow Modeling

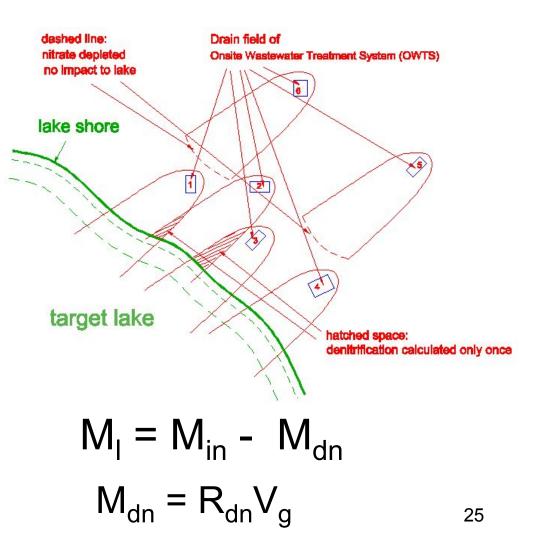

- Flow paths from each septic tank to surface water bodies
- Flow velocity along the flow paths. Heterogeneity of hydraulic conductivity and porosity is considered.
- Travel time from septic tanks to surface water bodies

# Nitrate Transport Modeling

#### Outputs of Nitrate Transport Modeling and Calculation of Nitrate Load

- Apply the analytical solution to each septic tank.
- Obtain the nitrate plume of the entire area.
- Calculate mass of inflow and denitrification.
- Calculate load to rivers

#### Development of the ArcGIS Extension

- All the development is within ArcGIS, including pre-processing, post-processing, and computation.
- We developed a user-friendly interface using Visual Basic.

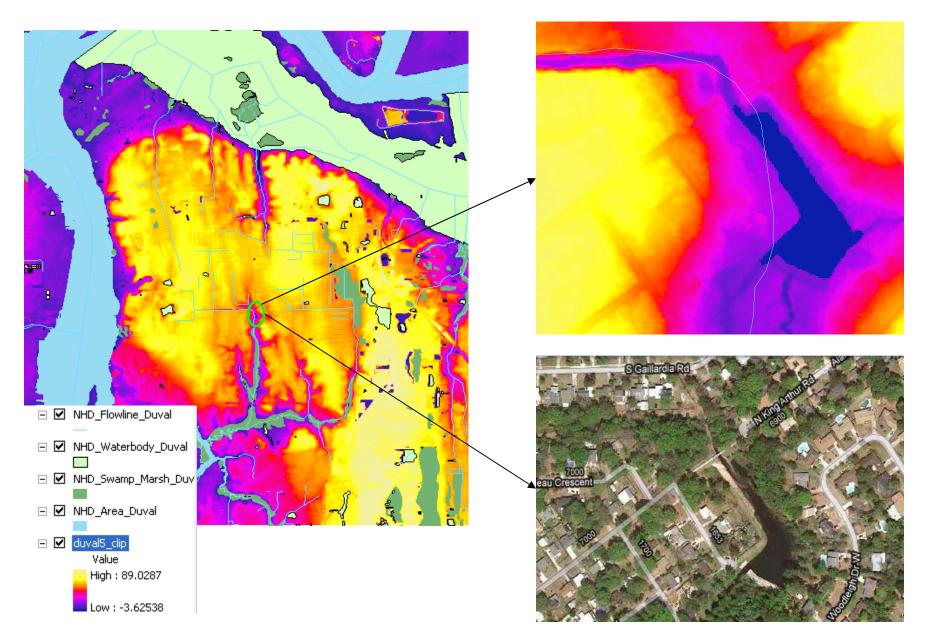

– The .NET framework is used to expedite development.

- The software development is for ArcGIS 9.3.
  - The software can be updated with newer version of ArcGIS.
- Final product is an installation file that installs the ArcGIS extension on PC.

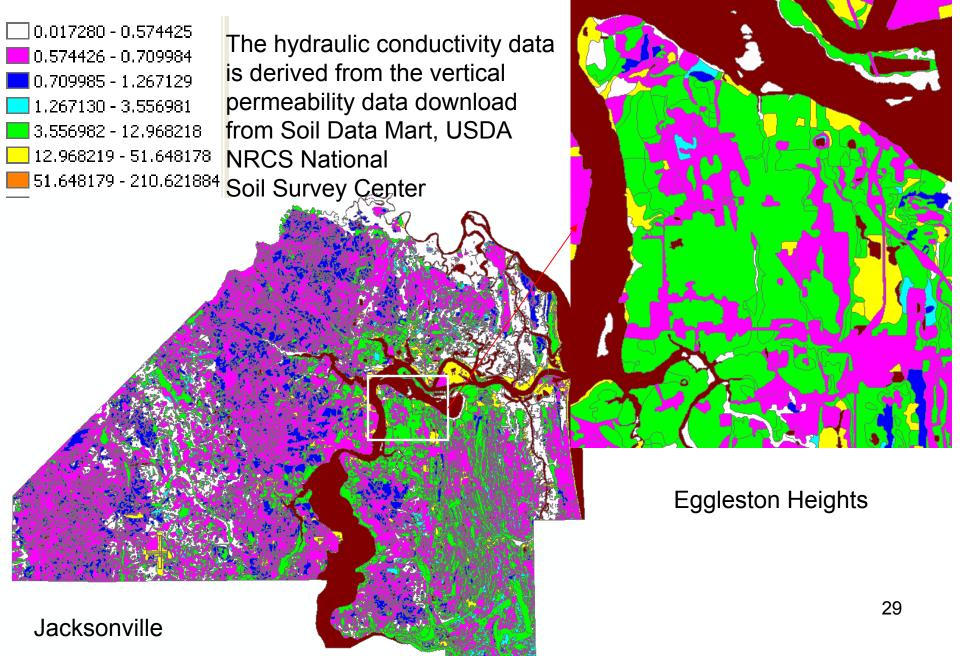

#### Summary of Model Inputs and Outputs

- Model Inputs
  - Flow module: DEM, Water bodies, Hydraulic conductivity, and Porosity
  - Transport module: Source nitrate concentration, Dispersivity, and Decay coefficient
  - Denitrification module: none
- Model Outputs
  - Flow module: Flow velocity and path
  - Transport module: Nitrate plume
  - Denitrification module: Amount of nitrate load

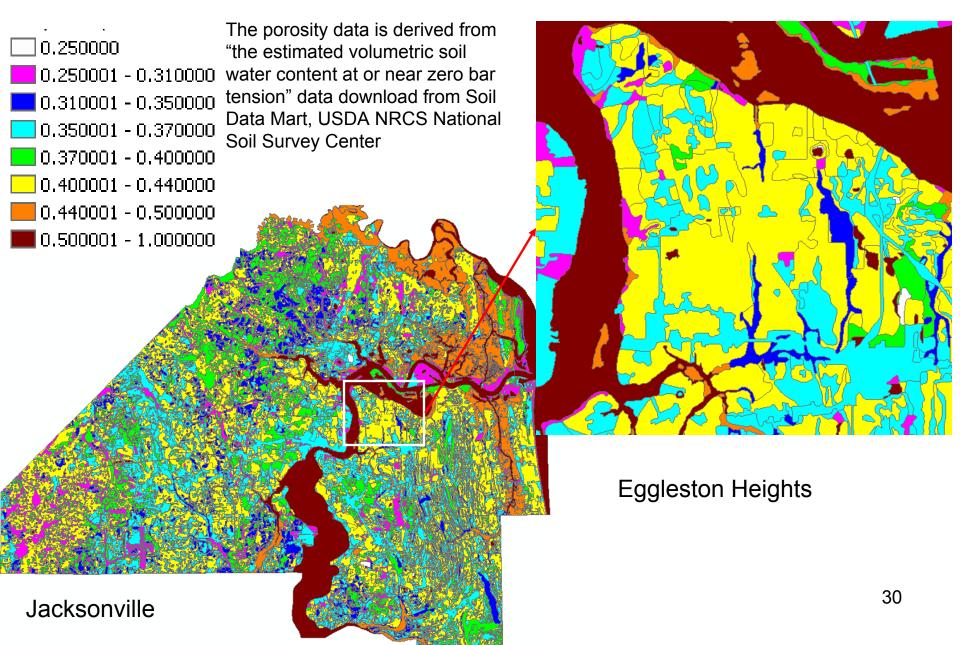

#### Use LiDAR Data to Update NHD Data

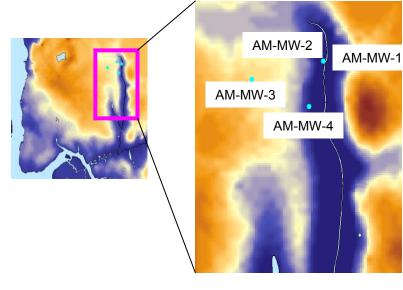

#### Heterogeneous Hydraulic Conductivity

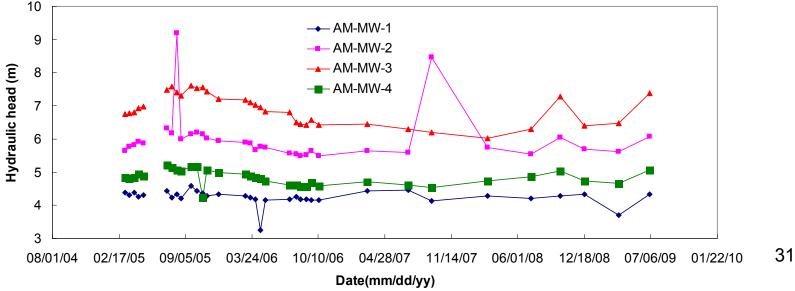

#### Heterogeneous Porosity

# **Observations of Hydraulic Head**

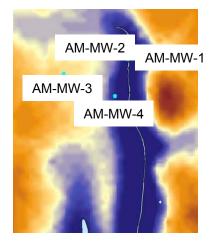

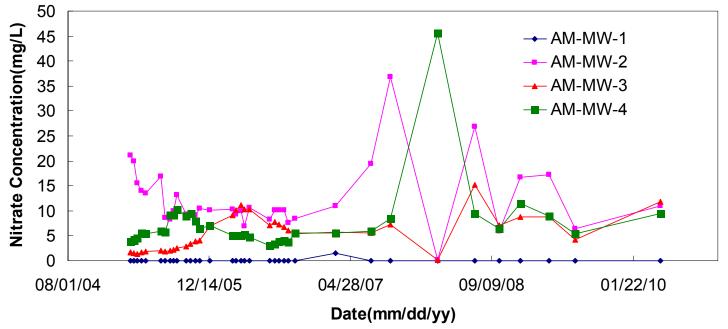

- Four monitoring wells
- Monitoring data from 2005 to 2009
- Water table is relatively stable

#### **Observations of Nitrate Concentration**

- Monitoring data from 2005 to 2010
- Observations vary but without apparent increasing or decreasing trends
- Isotope data indicate that effect of lawn fertilizer on concentration is negligible.

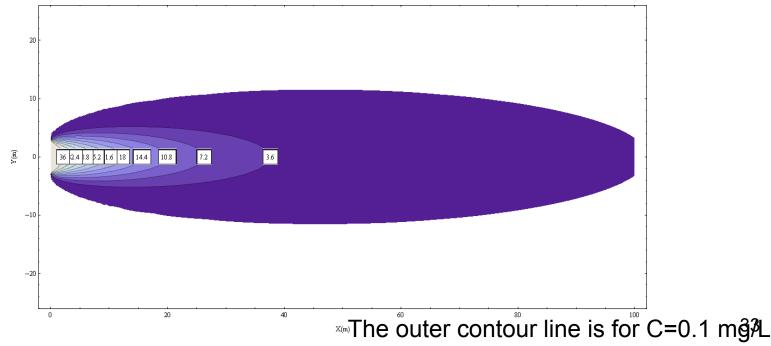

### Sensitivity Analysis

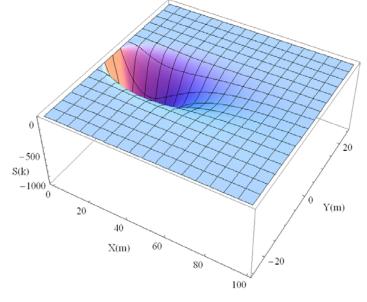

- What control plume size and nitrate concentration?
- Nominal parameters:

 $C_0=40$ mg/L, v=0.15m,  $\alpha_x=2$ m,  $\alpha_v=0.2$ m, and k=0.008/d

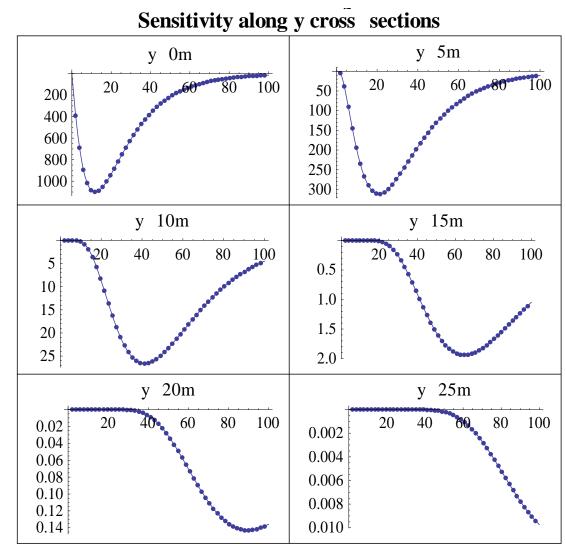

Corresponding concentration

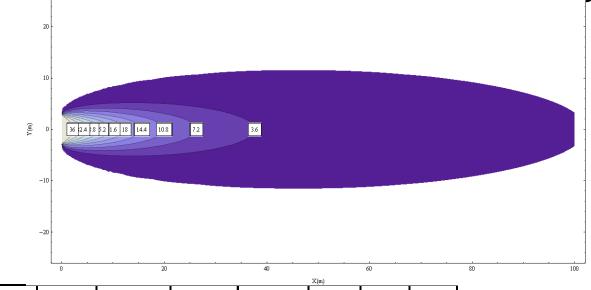

#### Sensitivity to k at Different Horizontal Cross-Sections

- k is important to concentration simulation.
- The sensitivity varies dramatically in space.

#### **Global Sensitivity Analysis**

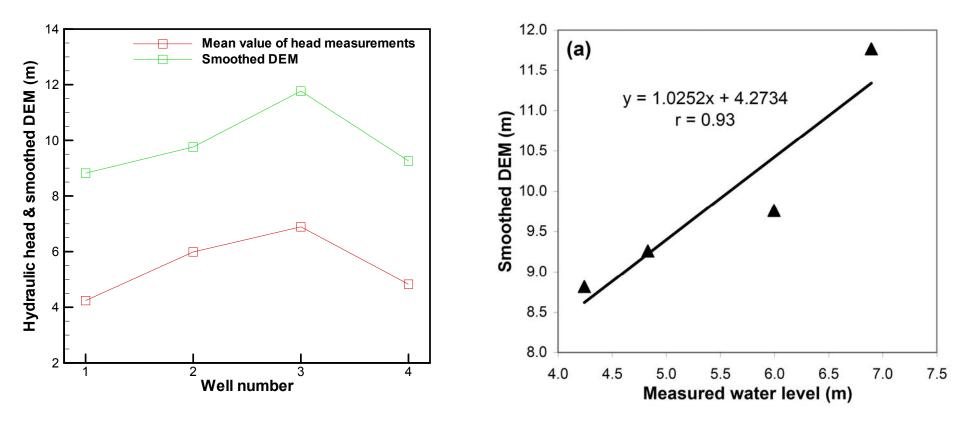

<b>x</b> (m)

10	1	a <sub>y</sub> , k	a <sub>y</sub> , k	k, a <sub>y</sub>	k, a <sub>y</sub>	k, v	k, v	k, v
12		a <sub>y</sub> , k	a <sub>y</sub> , k	k, a <sub>y</sub>	k, a <sub>y</sub>	k, a <sub>y</sub>	k, v	k, v

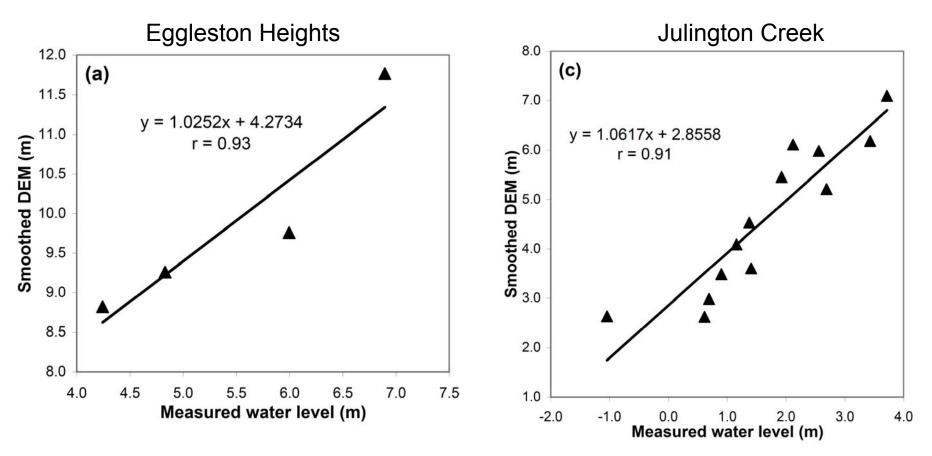

Two most critical parameters to simulated nitrate concentration at every location.

#### **Calibration Results: Heads**

- Smoothed DEM agree well with mean observed hydraulic head
- correlation coefficient of 0.93 and
- the slope of linear regression close to 1.

#### Calibration Results of Hydraulic Gradient

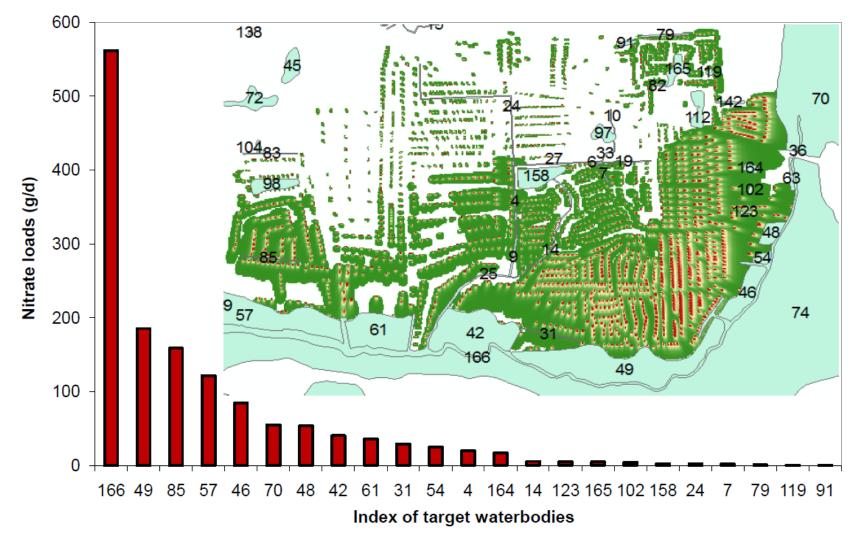

The smoothed DEM agree well with the observed water table shape with a linear correlation coefficient of more than 0.9 and slope of the linear regression close to 1.0

#### Estimated Source Input Mass Flux and Loads

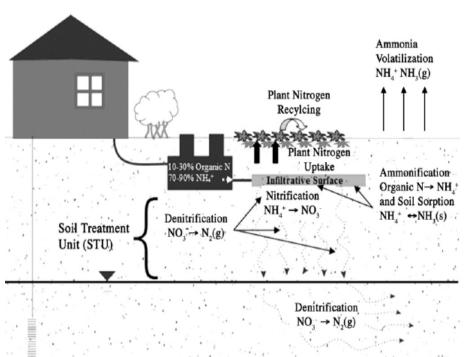

- Based on the summary report of Anderson (2006) for Florida, average source input mass flux is estimated as 20 g/sep/day.
- For Eggleston Heights, the estimated source input mass flux from 3495 septic systems is 115.4kg per day (33g/sep/day), about 92.5% of which is lost due to denitrification and 7.5% contributes to the loads to surface waterbodies.
- For Julington Creek, the estimated source input mass flux from 1924 septic systems is 59.4kg per day (31g/sep/day), about 97.6% of which is lost due to denitrification and 2.4% contributes to the loads to surface waterbodies.

#### Estimated Nitrate Load at Julington Creek

#### **Prospective Research**

- Continue developing the software to meet other needs of DEP environmental management and regulation.
- Consider nitrification process (e.g., nitrification and plant up-take) in the vadose zone.
- Apply this software to different sites to provide guidelines for environmental management and regulation.

Due to nitrification in the vadose zone, OSW can generate  $NO_3$ -N concentration at the water table from 25 to 80 mg N/L in most situations. (McCray et al., 2005) 40
